Fuel System

1. FOLD HERE

2. CUT HERE

Fuel System

Circle the type(s) of fuel system(s) in your aircraft:

- **Gravity-fed**
- **Pump Driven**
- **Fuel-injected**
- **Carbureted**

Fuel Capacity

1. FOLD HERE

2. CUT HERE

Fuel Capacity

Total:________ gal. Usable:________ gal.

TIP:

Some airplanes have long range and/or tip tanks. Make sure you use the correct "usable" fuel amounts for your airplane's endurance calculations.

Fuel Drains and Locations

1. FOLD HERE

Fuel Type and Weight

1. FOLD HERE

2. CUT HERE

Fuel Drains and Locations

Number of Drains: ________

Locations: ______________________________

____

____

Fuel Type and Weight

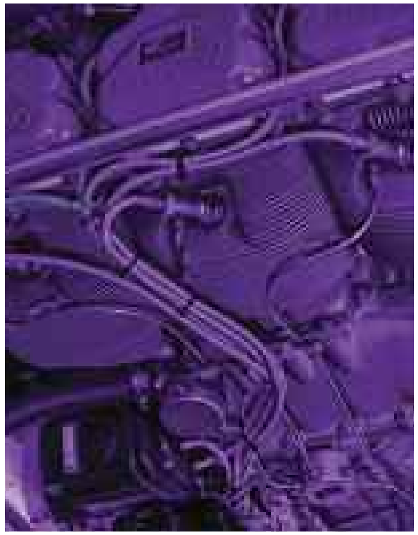
Type (e.g., avgas, jet)**:** ______________________

Weight: ____________ **lb./gal.**

2. CUT HERE

Engine

(Make, Model, HP, rpm)



1. FOLD HERE

2. CUT HERE

Oil

(Min./Max./Type)

1. FOLD HERE

Engine

Make: ____________ **Model:** ______________

Horsepower: ________ **Max. rpm:** ________

TIP:

Engine model numbers can tell you a lot. For example, a C172R has a Lycoming IO-360 engine. The "I" means fuel injected and the "O" means the cylinders are horizontally opposed. The "360" refers to cubic inches of displacement, describing the physical size of the engine.

2. CUT HERE

Oil

Minimum: __________

Maximum: __________

Type: __________

Magneto Check

Electrical System

2. CUT HERE

1. FOLD HERE

1. FOLD HERE

Magneto Check

Runup rpm:________ Max. rpm Drop:________

Max. Difference Between
Left and Right________

TIP:

Question on how magnetos work? Check out the AOPA Air Safety Foundation's *Engine and Propeller* online course at www.asf.org/courses.

2. CUT HERE

Electrical System

Alternator Voltage:________ Battery Voltage:________

Alternator Amperage:________

Abnormal Indications and Warnings:

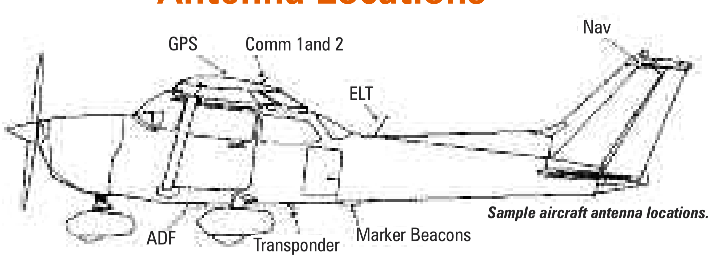
____

TIP:

Electrical component amperage is listed on the faces of the circuit breakers. Turning OFF the components with the largest draw will lengthen the life of the battery following an alternator failure.

Antenna Locations

Antenna Locations

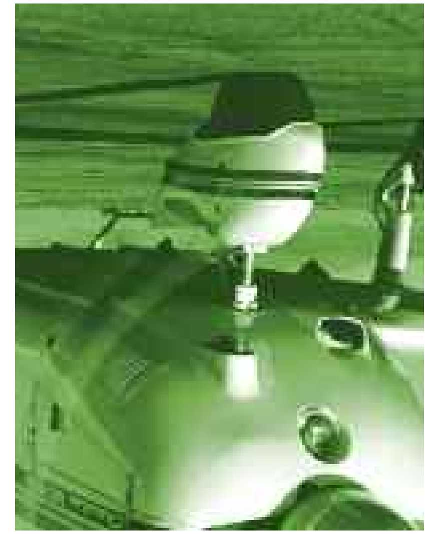


Sample aircraft antenna locations.

TIP:

Aircraft antenna locations vary based on the aircraft make/model and equipment installed.

Nosewheel Steering



Nosewheel Steering

☐ **Steerable through _______ degrees**

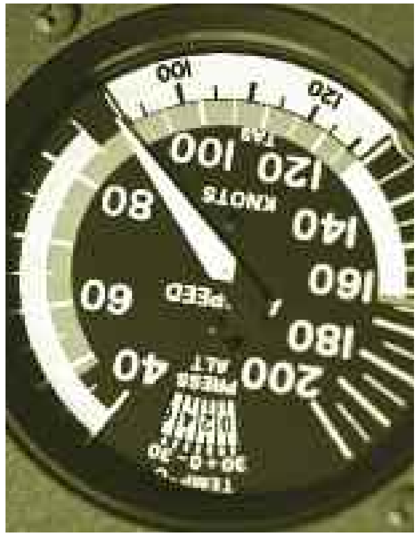
or

☐ **Free Castering**

TIP:

This is important when maneuvering the aircraft on the ground with a tug and/or tow bar. Look for markings on the nosewheel strut, wheel pant, or cowling that indicate the steering limit. This does not apply if the nosewheel is free castering.

V_{NE}



1. FOLD HERE

2. CUT HERE

Maximum Weights

1. FOLD HERE

V_{NE} - Never Exceed Speed

____

TIP:

V_{NE} is denoted by the red line.

2. CUT HERE

Maximum Ramp Weight

__________ **lb.**

Maximum Takeoff Weight

__________ **lb.**

TIP:

Maximum ramp weight usually includes the weight of fuel needed to taxi and complete the runup. This is why the maximum ramp weight may exceed the maximum takeoff weight in the normal category.

1. FOLD HERE

2. CUT HERE

V_A - Maneuvering Speed

At Max. Gross Weight: _____

TIP:

V_A is the maximum speed at which you may apply full control deflections without over-stressing the airplane. It varies with weight. Pilots should fly below this speed in severe turbulence.

1. FOLD HERE

2. CUT HERE

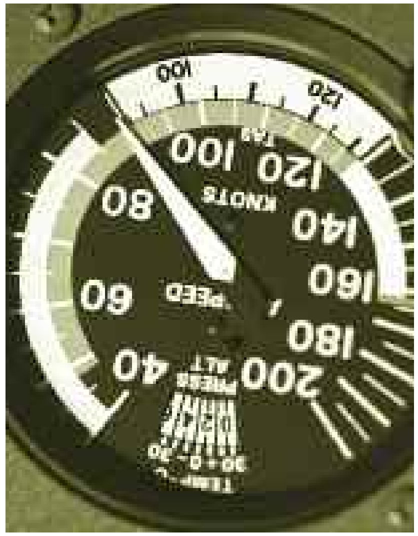
V_{NO} - Maximum Structural Cruising Speed

_____

TIP:

V_{NO} is shown where the green and yellow arcs meet. It should not be exceeded except in smooth air.

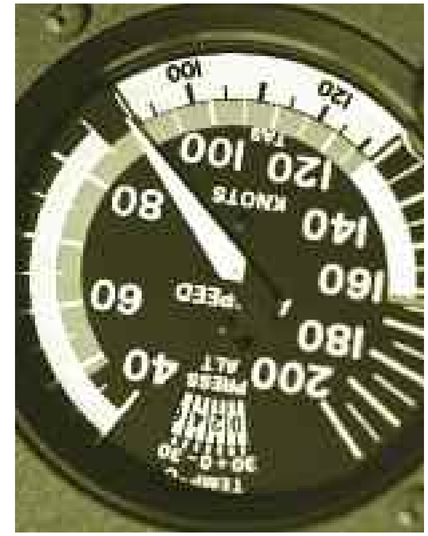
V_X



1. FOLD HERE

2. CUT HERE

V_Y



1. FOLD HERE

V_X - Best Angle of Climb

____

TIP:

V_X delivers the greatest altitude gain over a given **distance**.

2. CUT HERE

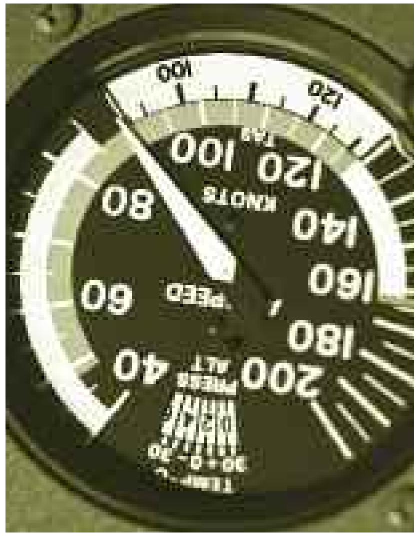
V_Y - Best Rate of Climb

____

TIP:

V_Y delivers the greatest altitude gain over a given period of **time**.

V_{FE}

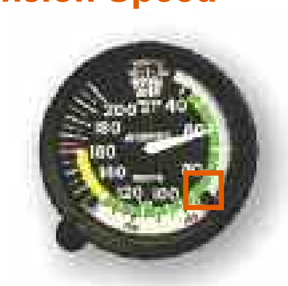


1. FOLD HERE

2. CUT HERE

V_{FE} - Maximum Flap Extension Speed

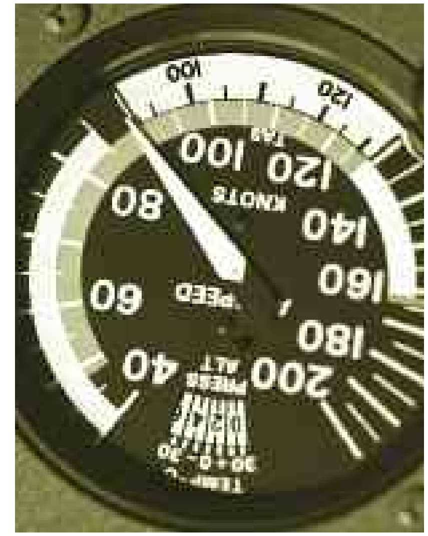
Increment	Speed
______	______
______	______
______	______
______	______



TIP:

Flap operating range is shown on the airspeed indicator by the white arc. Often, the first flap extension speed is not included in the white arc.

V_R



1. FOLD HERE

2. CUT HERE

V_R - Rotation Speed

Normal: ____________

Short-field: ____________

Soft-field: ____________

TIP:

This is ***not*** marked on the airspeed indicator and will change depending on the takeoff procedure.

Vso

Vs1

1. FOLD HERE

1. FOLD HERE

2. CUT HERE

V_{SO} - Stall Speed – Landing Configuration

____________ 0º Bank
____________ 60º Bank

TIP:

V_{SO} is shown on the bottom of the white arc.

Remember: V_{SO} = "Stuff Out," which means gear and flaps extended.

2. CUT HERE

V_{S1} - Stall Speed – Clean

____________ 0º Bank
____________ 60º Bank

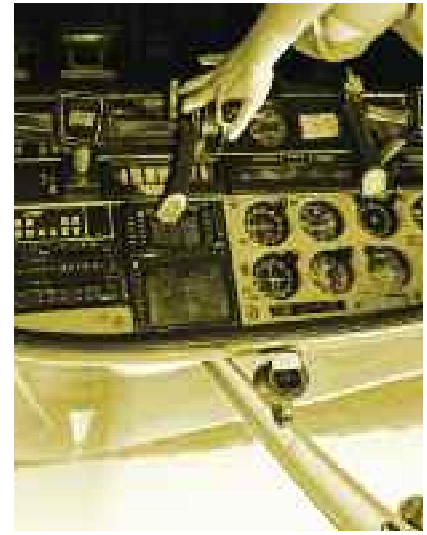
TIP:

V_{S1} is shown on the bottom of the green arc.

Remember: V_{S1} = "Stuff In," which means gear and flaps retracted.

Normal Landing Procedures

Normal Takeoff Procedures



1. FOLD HERE

1. FOLD HERE

2. CUT HERE

2. CUT HERE

Normal Landing Procedures

Leg	Power Setting	Flap Setting	Airspeed
Crosswind:	________	________	________
Downwind:	________	________	________
Base:	________	________	________
Final:	________	________	________

TIP:

Memorizing proper power settings and airspeeds for each segment of the approach will help stabilize the approach and landing.

Normal Takeoff Procedures

Flap Setting: ________

Rotation Speed: ________

Climb Speed: ________

Short-Field Landing Procedures

Short-Field Takeoff Procedures

1. FOLD HERE

2. CUT HERE

Short-Field Landing Procedures

Leg	Power Setting	Flap Setting	Airspeed
Crosswind:	______	______	______
Downwind:	______	______	______
Base:	______	______	______
Final:	______	______	______

TIP:

The objective of the short-field landing is to transfer the aircraft's weight from the wings to wheels as soon as possible. Touch down as slowly as possible, while simultaneously applying maximum braking.

Short-Field Takeoff Procedures

Flap Setting: ______

Rotation Speed: ______

Climb Speed: ______

Flap Retraction: ______

TIP:

The objective of the short-field landing is to transition from the takeoff roll to best-angle-of-climb speed as quickly, efficiently, and safely as possible. This generally means using minimal runway length, neutral elevator for low drag, proper flap setting, and avoiding lifting off too soon.

Soft-Field Landing Procedures

1. FOLD HERE

Soft-Field Landing Procedures

Leg	Power Setting	Flap Setting	Airspeed
Crosswind:	________	________	________
Downwind:	________	________	________
Base:	________	________	________
Final:	________	________	________

TIP:

The objective of a soft-field landing is to have the wings support the aircraft's weight as long as possible, which helps minimize the chance of sinking in the soft soil. Touch down as softly as possible, hold the nosewheel off the ground, and avoid unnecessary braking. You may need to add power in the flare to avoid a hard landing.

2. CUT HERE

Soft-Field Takeoff Procedures

1. FOLD HERE

Soft-Field Takeoff Procedures

Climb Speed: ________

Flap Setting: ________

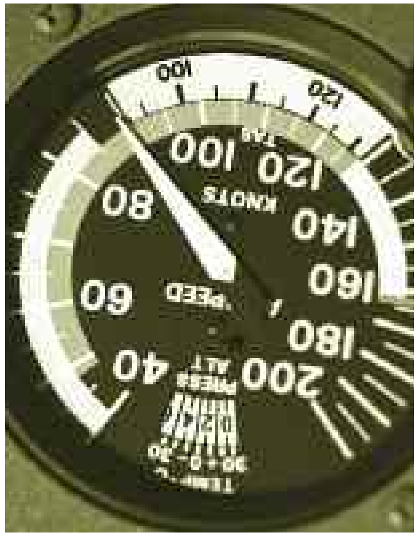
Flap Retraction: ________ **(airspeed *or* altitude)**

TIP:

Don't forget these soft-field takeoff techniques: Hold full aft elevator while taxiing into position and avoid unnecessary stopping or braking. After rotation, remember to fly in ground effect until reaching the proper climb speed. In many light general aviation aircraft you may need to push forward on the yoke to stay in ground effect while building up airspeed.

2. CUT HERE

Best Glide Speed



1. FOLD HERE

2. CUT HERE

Best Glide Speed

TIP:

Most light general aviation aircraft will glide about two miles for every 1,000 feet of altitude. Usually you'll want to extend the glide as long as possible by strictly maintaining the best glide speed and keeping the aircraft's configuration clean (e.g., gear and flaps up, feathered prop).

Maximum Demonstrated Crosswind Component

1. FOLD HERE

2. CUT HERE

Max. Demonstrated Crosswind Component

TIP:

This is the maximum crosswind in which the aircraft was tested during certification. Although it is not *technically* a limitation, it should be treated as one.

Emergency Procedures:

Engine Failure

Types of Operations

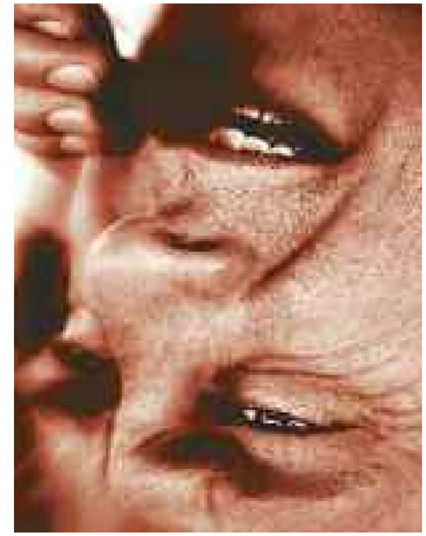
Inadvertent Icing Encounter

Emergency Procedures:

Electrical Fire in Flight



1. FOLD HERE

2. CUT HERE

Emergency Procedures: Inadvertent Icing Encounter

TIP:

Due to lack of anti- or deice equipment, most light general aviation aircraft are not approved for flight into icing conditions. If the aircraft is not equipped and certified for icing, you **MUST** exit icing conditions immediately. If you have an inadvertent icing encounter in an aircraft without windshield anti-ice, adjust the defroster setting to provide maximum heat to help keep a portion of the windshield clear. Turn off the cabin heat, if that will provide more heat to the windshield.

For more information, visit www.asf.org/advisors and select the *Aircraft Icing Safety Advisor*, and take the *Weather Wise: Precipitation and Icing* online course at www.asf.org/courses.

Emergency Procedures: Electrical Fire in Flight
